Automated Picking System

September 1, 2016

Modula will introduce its Modula OnePick picking system, a highly customizable edition of its original Modula Lift.

"Modula OnePick combines the vertical lift module's technology with a sophisticated automated system for the picking or replenishment of a single product at the time, directly from the bay, reducing to zero the error margin and guaranteeing the highest level of safety," said a company spokesperson. "Moreover, the OnePick allows products to be picked and replenished in a fully automated way in combination with a delivery and takeaway conveyor via the introduction of an innovative secure delivery interface window, which provides greater accuracy and precision."

At the operator's request, OnePick retrieves the selected item and places it in a retrieval location in the secure delivery window. The unit's design ensures that when the door opens automatically, the operator has access to that requested item. With this feature, inventory is always safe and under control.

OnePick's added customization provides users with the option of switching operation modes from standard vertical lift, with access to SKUs from a full tray, to a restricted access single pick device. OnePick can be integrated into a fully automated line and at the same time serve alongside human operators.

Manufacturing News

Manufacturing News is a monthly metalworking manufacturing publication that informs over 100,000 monthly readers of manufacturing solutions and new technology and the application of that technology in precision machining, production machining, fabricating of metals and composite materials. We welcome news releases that fit our editorial profile. The manufacturing we write about is the machining or fabricating that results in the creation of components, i.e., the manufacturing of discrete parts.
