The Modula OnePick is a vertical lift module featuring a precise picking system. The automated system enables single products to be picked and replenished directly from the bay, promoting increased safety and a reduced error margin, says the company. The system uses a secure delivery interface window to enable operators to pick and retrieve items, facilitating increased accuracy and precision.

The storage system enables users to switch operation modes from standard vertical lift, with access to SKUs from a full tray, to a restricted-access single-pick device. The machine can also be integrated into a fully automated line to offer further versatility and flexibility, says the company.
